Applied Database Technologies

Extra Credit: Views and Triggers

Create a VIEW called customers_private_info that contains three columns:

- customer_id
- email_address
- password

**CREATE VIEW customers_private_info AS**

**SELECT customer_id, email_address, password**

**FROM customers c;**

**SELECT * FROM customers_private_info;**

Create a trigger called customers_password_length_check that verifies the length of the password hash is exactly 40 characters before an update occurs. Be sure to explain in the error that the password hash length must be 40.

Provide an UPDATE statement that attempts to update a row in the customers_private_info VIEW to a password of non 40 length to trigger the error message.

**DELIMITER //**

**CREATE TRIGGER customers_password_length**

**BEFORE UPDATE ON customers**

**FOR EACH ROW**

**BEGIN**

**SELECT SUM(password_length)**

```
    INTO sum_password_length
    FROM customers
    WHERE password = NEW.password;

        if(LENGTH(password) != 40) THEN  SIGNAL SQLSTATE 'HY000'
    SET MESSAGE_TEXT = 'Not 40 characters' ;
    END if;
END //

UPDATE customers
SET password = 'Not 40 characters'
WHERE LENGTH(password) != 40;
```
